46th Street Information

Kohl,

Please find the desired information regarding 46th Street attached. We have put together a master aerial photo that shows the right of way width in yellow, the street and sidewalk widths in purple, a log of seven photos in pink. I think you find the photos helpful as you try to envision what conditions are for 46th Street as it lies between Hiawatha and Minnehaha. Below we have estimated the cost of installing a bituminous median at \$10,000. Please be careful in your use of the number and idea of installing the median. Frequently we run into drainage problems and other assorted unknowns which drive the price of the work up. If you intend to use the cost figures please include a hefty contingency and additional markup for engineering.

Jim

Subject: 46th Street Information

Jim,

Tom said you would like the information on 46th Street in electronic format. I have attached both the layout with measurements and the photos in PDF format.

Also, I asked operations for an estimate of a monolithic 6' bituminous median. Their estimate was \$8-10 per linear foot. I measured the distance between Minnehaha Avenue and Hiawatha Avenue at approximately 800 feet. This would work out to a total cost of \$8,000-\$9,600. This is for the median only and does not include any extraneous work, such as striping, etc.
